

## TIE2140 Engineering Economy Solutions to Tutorial #1

### Question 1.

Spivey's cash flows diagram:

The present equivalent value of Spivey's cash flows is

$$\begin{aligned} P &= 400,000 + 400,000 [P/A, 2\%, 24] \\ &= 400,000 (1 + 18.913925603) \\ &= \underline{\underline{\$ 7,965,570.24}} \end{aligned}$$

Or

$$\begin{aligned} P &= 400,000 [P/A, 2\%, 25] [F/P, 2\%, 1] \\ &= 400,000 (19.52345647) (1.0200) \\ &= \underline{\underline{\$ 7,965,570.24}} \end{aligned}$$

Spivey did not really win \$10 million because the payments were received in installments and the time value of money means the actual amount he won is actually lower.

## Question 2.

The cash flows may be decomposed into 2 parts:

Equivalent value at the end of Year 2022:

$$\begin{aligned} F_4 &= -1,000 [F/A, 8\%, 4] + 200 [F/G, 8\%, 4] \\ &= -1,000 (4.506112) + 200 (6.326400) \\ &= -3,240.83 \end{aligned}$$

Equivalent value at the end of Year 2023:

$$\begin{aligned} F_5 &= F_4 [F/P, 8\%, 1] \\ &= -3,240.83 (1.08) \\ &= -\$ \underline{\underline{3,500.10}} \end{aligned}$$

Alternative solution:

$$F_5 = (-1,000 [P/A, 8\%, 4] + 200 [P/G, 8\%, 4]) [F/P, 8\%, 5] = -\$ \underline{\underline{3,500.10}}$$

### Question 3.

Note that the total number of years = 6, i.e., 5 more years in addition to the first.

If a higher quality heat exchanger is purchased, the cash flow diagram for the savings in replacement and downtime cost is as follows:

Given

- $i = 0.18$
- $A_1 = 175,000$
- $f = 0.08$
- $N = 6$

The present equivalent value (for the case of  $f \neq i$ ) of the savings =

$$\begin{aligned} P &= \frac{A_1[1 - (1+i)^{-N}(1+f)^N]}{(i-f)} \\ &= \frac{175,000[1 - (1+0.18)^{-6}(1+0.08)^6]}{(0.18 - 0.08)} \\ &= \$ 721,300.48 \end{aligned}$$

Hence, you can afford to spend as much as **\$ 721,300.48** now for a higher-quality heat exchanger.

#### Question 4.

Amount borrowed = \$5,000

(a)

Number of monthly payments = 48.

Interest rate = 6% per year compounded monthly which is equivalent to  $6/12 = 0.5\%$  per month compounded monthly

$$\begin{aligned}\text{Monthly payment} &= 5,000 [A/P, 0.5\%, 48] \\ &= 5,000 (0.0234850) \\ &= \$ \underline{\underline{117.43}}\end{aligned}$$

(b)

Number of monthly payments = 60

Interest rate = 9% per year compounded monthly which is equivalent to  $9/12 = 0.75\%$  per month compounded monthly

$$\begin{aligned}\text{Monthly payment} &= 5,000 [A/P, 0.75\%, 60] \\ &= 5,000 (0.0207584) \\ &= \$ \underline{\underline{103.79}}\end{aligned}$$

### Question 5.

There are 60 months from 1 January 2020 to 1 January 2025. The cash flow diagram is as follows:

Let  $i$  = interest rate per month.

We require that

$$400,000 = 200,000 [F/P, i\%, 60] + 676 [F/A, i\%, 60]$$

By trial and error and linear interpolation:

$$\text{Try } i = 0.75\% \quad 400,000 > 364,126.69 \Rightarrow i > 0.75\%$$

$$\text{Try } i = 1.00\% \quad 400,000 < 418,548.72 \Rightarrow i < 1.00\%$$

$$\frac{i - 0.75}{400,000 - 364,126.69} = \frac{1.00 - 0.75}{418,548.72 - 364,126.69}$$

$$i = 0.75 + \frac{(400,000.00 - 364,126.69)}{(418,548.72 - 364,126.69)}(1.00 - 0.75)$$

$$= 0.009148 \text{ or } 0.9148\% \text{ per month}$$

Using Excel function:  $\text{rate}(60, 676, 200000, -400000, 0.1) = 0.00918742$

Using Python:  $\text{numpy\_financial.rate}(60, 676, 200\_000, -400\_000) = 0.00918742$

The *nominal* interest rate = 12 (0.918742%)  
= **11.0 % per year compounded monthly.**

The *effective* interest rate =  $(1 + 0.00918742)^{12} - 1$   
= 0.116 or **11.6% per year.**

### Question 6.

Amount borrowed = \$20,000.00

Repayment period = 10 years

Payment frequency = monthly

Interest rate = 9% per year compounded continuously which is equivalent to  $9/12 = 0.75\%$  per month compounded continuously

Number of monthly payments = 120.

Monthly payment =

$$\begin{aligned}A &= 20,000 [A/P, \underline{0.75\%}, 120] \\&= 20,000 \left[ \frac{e^{0.0075(120)}(e^{0.0075} - 1)}{e^{0.0075(120)}} \right] \\&= 20,000 (0.012685896) \\&= \$ 253.72\end{aligned}$$

Hence the amount for each payment is \$ 253.72
